Studying the learning benefits of GenAI: questions and readings

Joshua Weidlich, University of Zurich · Tallinn University, 11 November 2026

Handout for the talk *The challenge of studying a technology's learning benefits* (AI Lab for Research on Teaching and Learning, Tallinn University). Slides and materials: joshuaweidlich.github.io/talks/tallinn-2026

Four questions for any study

1. **What exactly was the intervention?** Tool and model version, prompts and instructions, time, teacher support, and what students actually did.
2. **Compared to what?** What the comparison group did in the same time, with the same content and support.
3. **What was learned, and how was it measured?** Knowledge or skill; tested with or without AI access; independent test, researcher-made test, or self-report.
4. **Which claim does the study support?** A programme effect, a design principle, a mechanism, or a description. A claim about the medium as such is usually out of reach.

Further checks

- **Replaceability.** Could another medium, or a person, have delivered the same method? If so, the result is about the method (Clark, 1994).
- **Comparable activity.** Were students doing cognitively comparable things in both groups? Many large effects come from groups that were not (Küchemann et al., 2026).
- **Performance or learning.** Was the test taken with or without AI? Unrestricted GPT-4 raised practice scores by 48% and lowered exam scores without AI by 17% (Bastani et al., 2025). Self-report does not replace a test (Deslauriers et al., 2019).
- **Access or use.** Who used the tool, how, and how much? Did the comparison group use AI too? Log data answers most of this.
- **Expectations.** Did both groups expect the same benefit? Matching time alone leaves expectation effects in place (Boot et al., 2013).
- **Effect size.** In causal education studies with standardised tests, 0.20 SD is already large. Small samples, researcher-made tests and evaluations run by the developer tend to show larger effects (Kraft, 2020; Wolf et al., 2020).
- **Shelf life.** Which model, tested when? Of 50 widely cited claims about LLMs, 44% no longer held on newer models (Queen & Zou, 2026).

- **Informative null.** Would a null result have told us anything? If not, a positive result tells us little about the technology either.
